SKILL PUBLISHER

Groundwork

The base every framework we build stands on: named steps, checks that can fail, and memory that outlives the session.

The problem it solves

Agent work that lives in a chat window cannot be reviewed, repeated or handed over. It produces something once, in a form nobody can inspect halfway through, and the next person starts again from an empty prompt. The fix is not a better prompt. It is a shape.

Named steps
run in order, stop at any

Parallel where it pays
one agent per independent part

Checks that fail
and do, on real runs

The anatomy

1. **Named steps, not a chat window**
   Each stage is a command your team runs deliberately and can stop at, so the work is inspectable between steps rather than emerging whole from one conversation.
2. **Parallel where it genuinely pays**
   Sub-agents take the parts that are actually independent: one per bid question, one per source, one per market. A week of reading becomes an afternoon, and they do not quietly agree with each other.
3. **An adversarial stage that must be answered**
   The plan is attacked before it is built, and every finding is recorded with a decision against it, rather than left to whoever remembers to ask.
4. **Memory that outlives the session**
   What was decided, and why, persists across weeks and across machines. On Monday the framework knows everything it knew on Friday.
5. **Checks that can come back negative**
   Verification that can actually fail, and does. A pipeline whose checks always pass is not checking anything.
6. **Yours to run and change**
   A repository your team clones, reads, edits and runs without us.

What you get

- A repository rather than a service you rent, with people deciding at the points that need deciding.
- The same anatomy whatever the job is, which is what makes the second framework cheaper than the first.
- A baseline of the job as your team does it today, so every later figure compares against something real.
- Steps you can stop at, which is what makes an agent's work reviewable at all.

Groundwork is the base. Bidline, Pricepoint, Throughline and Milestone are built on it, and so is whatever we build for your recurring job. Framework builds from £1,500 + VAT, scoped before any price is agreed.
