SKILL PUBLISHER

What arrives, and what to do with it

A folder, four files, and about ten minutes to have it running.

The problem it solves

A skill is not a subscription or a service call. It is a small folder of Markdown your agent reads. Knowing what is in it, where to put it and how to check it still works is the difference between a delivery that gets used and one that sits in a downloads folder.

Plain Markdown
no runtime, nothing calling home

Open format
the Agent Skills format

Yours
kept, edited, versioned

What is in the folder

1. **SKILL.md**
   The skill itself: the frontmatter deciding when it loads, and the rules the agent follows. Inside the format's hard limits, checked mechanically rather than by eye.
2. **SKILL.evals.md**
   Your questions, answered with the skill and without it, with the differences stated. This is the evidence, including anywhere the skill made no difference.
3. **SKILL.citations.md**
   Each claim traced to the source it came from, so a reviewer can check the skill rather than trust it.
4. **SKILL.changelog.md**
   What changed, when, and on what evidence, so a later refresh starts from a record instead of a guess.

The first ten minutes

- Drop the folder into your agent's skills directory, commit it, and it loads from the next session.
- Put it where your team already reviews code, because it is a text file and belongs in review.
- Run your own questions against it once, so you have seen it work in your environment.
- Keep the eval file: it is what makes a later refresh measurable rather than a rewrite.

We research the field

We write the skill

We test it against your questions

You keep the folder

Works with any tool that reads the open Agent Skills format. Nothing is licensed per seat and nothing phones home.
